

① Correction du DS de SI, 17 PSI 1, Avril 25

[Exo] $V = \varphi \frac{z_{21}}{z_{22}} \frac{z_{23}}{z_{32}} \text{ Nmt } \frac{1}{60} = 5 \times \frac{15}{75} \times \frac{15}{35} \times \frac{1500}{60} = 10 \text{ mm/s}$

[Pb]

Q1	Ramuel	Collabo	Planche	Esclave
Fm	x	x	x	
F0	x	x		x
Cm		x	x	x

Q2 1.5 : Réversibilité

Q3 1: mouvement ; 2: viss - ecran ; 3: décalage ; 4: décalage

5: translation ; 6: Enregre éléc ; 7: rotation ; 8: translation

Q5 $\vec{R}_0^2 = \vec{R}_K^2 + \vec{R}_{\epsilon_K}^2 + \vec{R}_0^1 = \vec{R}_B^2 + \vec{R}_0^3$

$$\omega_{2e} \vec{y}_0 + \omega_{K,R} \vec{y}_0 + \omega_{\epsilon_{K,R}} \vec{y}_2 + \omega_{y_0} \vec{y}_0 = \omega_{23} \vec{x}_0 + \omega_{30} \vec{x}_0$$

$$(\omega_{2e} + \omega_{K,R} + \omega_{y_0}) \vec{y}_0 + \omega_{\epsilon_{K,R}} \vec{y}_2 = \omega_{20} \vec{x}_0$$

$$\omega_{\epsilon_{K,R}} \vec{y}_2 \cdot \vec{x}_2 = \omega_{20} \vec{x}_0 \cdot \vec{x}_2 \Rightarrow 0 = \omega_{20} \cos(\alpha + \beta)$$

$$\Rightarrow \omega_{20} = 0$$

Rem : $\omega_{K,R}$: roulement

$\omega_{\epsilon_{K,R}}$: pivotement

Q7 $\vec{OB} = \vec{OA} + \vec{AB} = y_A \vec{y}_0 + x_B \vec{x}_1 + y_B \vec{y}_1$

$$d = 2 \vec{OB} \cdot \vec{y}_0 = 2(y_A + x_B \sin \alpha + y_B \cos \alpha)$$

Q8 α petit $\Rightarrow d = 2(y_A + y_B + x_B \alpha) = a\alpha + b$

Courbe $\Rightarrow b = 8,25 \text{ mm}$ (pour $\alpha = 0$)

$$\text{pour } \alpha = 0,055 \Rightarrow d=0 \Rightarrow 0 = a \times 0,055 + 8,25$$

$$\Rightarrow a = - 183 \text{ mm}$$

$$Q9 \quad \vec{OA} + \vec{AE} + \vec{ED} = \vec{OD} + \vec{DC} + \vec{CE}$$

$$y_A \vec{y}_0 + x_E \vec{x}_1 + x_E \vec{x}_2 = x_D \vec{x}_0 + x_C \vec{x}_0 + y_C \vec{y}_0 + R_g \vec{y}_2$$

On cherche $x_D = \text{fonc } (\alpha, \text{ctg})$, on projette sur \vec{y}_2 pour "éliminer" x_C

$$\Rightarrow y_A \cos(\alpha + \beta) - x_E \sin\beta = -(x_D + x_C) \sin(\alpha + \beta) \\ + y_C \cos(\alpha + \beta) + R_g$$

$$\Rightarrow (x_D + x_C) \sin(\alpha + \beta) = y_C \cos(\alpha + \beta) + R_g + x_E \sin\beta - y_A \cos(\alpha + \beta)$$

$$\Rightarrow x_D = \frac{(y_C - y_A) \cos(\alpha + \beta) + x_E \sin\beta + R_g}{\sin(\alpha + \beta)} - x_C$$

$$Q10 \quad \begin{array}{ccc} \alpha & \text{---} & \boxed{K_D} & \text{---} & x_D \\ \Delta x & & & & \Delta x_D \end{array} \quad K_D = \frac{\Delta x_D}{\Delta x} = \frac{1}{0,065} = 22,2 \text{ mm/rad}$$

$$K_D = 0,022 \text{ m}$$

$$\text{Pour 1 mecanism} \Rightarrow \Delta l = \frac{a}{K_D} \frac{\pi}{2^{15}} = \frac{0,183}{0,022} \times \frac{\pi}{2^{15}} =$$

$$\Delta l = 0,00056 \text{ mm}$$

$$\Delta l = 0,56 \text{ nm} < 1 \mu\text{m} \quad \text{OK}$$

$$Q12 \quad R_g \text{ en I} \Rightarrow \dots \Rightarrow K_C = \frac{K_D - x_E \sqrt{3}}{2 \cdot R_g}$$
